Avicor Ltd. was established in 2005, 100 % owned by Hungarian management. It acts on the field of biotechnology as a research and development company.

Avicor fills the gap between chemistry and genomics by using chemical microarrays. Avicor has developed a proprietary surface chemistry, which enables us to print small molecules in high density onto microscope slides.

With this technology our company will open new markets where we can sell our own products, as well as provide services based on the company's own technology mainly for pharma and biotech companies. By our methods rapid and cost-effective screening of drug candidate molecules can be achieved. Avicor has a chemical molecular library with 40,000 compounds. By developing custom screening assays Avicor is able to identify novel, patentable hit molecules, which can be further optimized for leads. The company provides services from protein target to lead compound development. Besides drug candidate development Avicor is able to identify protein targets of almost any small compound by using its own proprietary affinity chromatography technique coupled with mass spectrometry.
