SOLVO Biotechnology - "The Transporter Company" - global leader in the development of membrane transporter assay systems that answer the following question in ADMETox:

- Do compounds get through the main pharmacological barriers?
- Do compounds reach their target tissue or cell?
- Do compounds cause transporter mediated drug-drug interactions?

In the last couple of years attention has turned towards these interaction studies due to the FDA guideline.

SOLVO has been the pioneer in the commercialization of transporter assay systems and has developed a unique number and combination of assays to test the interaction of compounds with individual transporters (MDR1, MRPs, BCRP, BSEP, NTCP, OATPs, PEPTs) and perform advanced transport studies. The company offers drug discovery products and screening services to pharmaceutical, biotechnology and consumer goods industries, relevant to many therapeutic areas and product categories. Most major pharmaceutical and biotechnology companies use SOLVO's assays, either in-house, or as contracted research to significantly reduce the time and cost of the compound development process.
